

Assessment criteria for project 3

Code (35%)

Code fulfills specification (20%)

The code is a working simulation producing the results you present (yes/no)

We assess if the code is working by inspection and checking if you computed at least one meaningful physical observable and presented it in your report.

If the code is not working we will not grade your project.

Documentation (5%)

- Functions and modules are documented adequately (i.e. includes all necessary details, but is not excessively long) with *docstrings*.
- There is a README file present to tell users how to run and analyze a simulation.

Structure (5%)

- The code is separated into functions (or classes) according to the simulation logic
- The only global variables are physical or simulation constants

Readability (5%)

- Variable and function names are understandable and of length strictly greater than one(except counters in loops), follow a logical scheme and are consistent.
- Nontrivial (and only nontrivial) parts of the code are commented.

Presentation (65%)

Theoretical background (10%)

The theoretical background of the simulation is adequately explained.

Presentation structure (10%)

The presentation has a structure fulfilling scientific standards: introduction/background, methods, results, summary, and key references.

Result presentation (15%)

Results of the simulations are properly presented and the physical meaning correctly discussed. Figures are clear and complete with proper axis labeling.

Validation of the simulation (15%)

The correctness of the simulation is tested properly, e.g. by comparing to known literature results.

Calculated quantities (15%)

The simulation produces correct results.
